

SERVICE ITEMS

A service reminder is displayed when the ignition is switched on or off until the trip computer is reset. The service reminder is displayed for a total of 10 seconds.

Reset Service Display

The service reminder can be reset at ignition on. To enter the reset function, press and hold the UP and DOWN buttons on the trip computer switch and turn the ignition on. The UP and DOWN buttons must be held for 2 seconds after the ignition switch is turned on.

The active service reset reminder is displayed.

To reset the displayed service reminder, press and hold the SET button for 3 seconds. A confirmation beep sounds upon reset.

NOTE: When resetting the service reminders, the PCM poll responses are cleared and the odometer readings for the last changes are recorded. These can be accessed by TECH 2.

When the service reminder is reset, the MFD shows the Service Reset No Items screen. After 2 seconds MFD advances to the System Check.

Prior to Service Due

Service Due is determined from the odometer reading. The MFD shows a reminder 1000 km before a service is due. The service interval becoming due is displayed on the MFD, and the spanner in the icon flashes. This service reminder is displayed for up to 10 seconds whenever the ignition is switched on or off until the service reminder is reset.

Service Due

When a service is due, the whole icon flashes. This service reminder is displayed for up to 10 seconds whenever the ignition is switched on or off until the service reminder is reset.

Service Overdue

When a service is overdue by less than 5000 km, the MFD shows a flashing icon for up to 10 seconds whenever the ignition is switched on or off until the service reminder is reset.

Service Well Overdue

When a service is overdue by more than 5000 km, the MFD shows a flashing icon for up to 10 seconds whenever the ignition is switched on or off until the service reminder is reset. This event is permanently logged in the instrument cluster memory (EEPROM) in case of future warranty disputes.

NOTE: When a Service Due reminder is reset, the PCM poll responses are cleared and the odometer readings for the last changes are recorded. These can be accessed by TECH 2. The next Service Due reminder will appear 1000 km before the next scheduled service period.
